No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

The invention provides a monoclonal antibody which has a specific reaction with the part peptide of the C-terminal of 19P2 ligand or its derivative. The antibodies can be used in diagnosis or to treat or prevent diseases associated with abnormality in the pituitary function regulatory mechanism (e.g. promotion of projectin secretion), central nervous regulatory mechanism, and pancreatic function regulatory mechanism. The antibody-based immunoassay can also be applied in ciarifying the physiological functions of the ligand and its derivative sequences AAV49290-302 represent peptide fragments of the 19P2 ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention provides a monocional antibody which has a specific reaction with the part peptide of the C-terminal of 19P2 ligand or its derivative. The antibodies can be used in diagnosis or to treat or prevent diseases associated with abnormality in the pituitary function regulatory mechanism (e.g. promotion of projectin secretion), central nervous regulatory mechanism, and pancreatic function regulatory mechanism. The antibody-based immunoassay can also be applied in clarifying the physiological functions of the ligand and its derivative. Sequences AAV49290-302 represent peptide fragments of the 19P2 ligand.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sox
               sequence represented in AAW31390 and is used in an assay to monitor ligand binding to the G protein-coupled receptor protein. Pharmaceutical compositions containing this ligand may be used as a pituitary function modulator. This ligand could have specific applications as a prophylactic or therapeutic agent for dementia, depression, hyperkinetic prophylactic or therapeutic agent for dementia, depression, hyperkinetic trauma, growth hormone secretory disease, hyper- and polyphagia, trauma, growth hormone secretory disease, hyper-lipidaemia, hypercholesterolaemia, hyperglyceridaemia, spinal injury, hyperprojactinaemia, disbetes, cancer, pancreatitis, renai disease, hyperilipidaemia, ceurosis, asthma, rheumatoid arthritis, spinal injury, transfent brain ischaemia, spilepsy, amylotrophic lateral sclerosis, acute myocardial infarction, infertility, spinocerebeilar degeneration, bone fracture, trauma, atopic dermatitis, osteoprosis and/or oligogalactia. Assays can also be developed to screen compounds which are capable of altering the binding activity of the ligand affecting activation of the G protein-coupled receptor protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

                                                                                      This invention describes a novel oxytocin secretion-regulating agent which contains a ligand poptide or its salt for the G protein-coupled receptor protein. It is useful in the form of drugs for amellorating, preventing and treating diseases relating to oxytocin secretion e.g. weak pains and atonic bleeding, before and after expulsion of placenta, uterine recovery failure, caesarean section, stoppage of artificial fertilization or galactostasis and is also applicable in veterinary medicine for promoting milk production in cow, goat and pig. This sequence represents a human peptide which acts as an oxytocin secretion
                                                                                                                                                                                                                                           Physiologically-active polypeptide recognized as ligand by G protein-coupled receptor protein, for promoting secretion of oxytocin, as drugs for diseases relating to oxytocin secretion and in veterinary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; oxytocin secretion promoter; G protein-coupled receptor prote treatment; disease; pain; atonic bleeding; uterine recovery failure; caesarean section; artificial fertilization; galactostasis; goat: pl

The antibodies can be used in diagnosis or to treat or prevent diseases associated with abnormality in the pituitary function regulatory mechanism (e.g. promotion of prolactin secretion), central nervous regulatory mechanism, and pancreatic function regulatory mechanism, and pancreatic function regulatory mechanism. The antibody-based immunosassy can also be applied in clarifying the physiological functions of the ligand and its derivative sequences AAY49290-302 represent peptide fragments of the 19P2 ligand.

This can be used to control the secretion of CRH and is useful as an analysisc or for treating, preventing or ameliorating diseases associated with CRH secretion such as hyperaldosteronism, hypercortisolaemia, secondary or chronic hypeadremocorticism, Addison's disease (including boredom, nausea, pigmentation, hypogonadism, hair loss, and hypotension), adrenal gland hypofunction and obesity. The present sequence is a peptide used in the exemplification of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a modified therapeutic peptide (I) C comprising a therapeutically active amino acid region (III) and a creative group (II) (e.g. succinimidy) and maislands groups) attached to c reactive group (II) (e.g. succinimidy) and maislands groups) attached to c peptides therapeutically active amino acid region (IV), which covalently c bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3-50 amino acids. (I) are useful for modifying therapeutic peptides e.g. hormones, growth c factors and neurotransmitters, to protect them from peptidase activity c in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent c administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (haif cife) and specificity as bonding to inrease length of activity (haif cife) and specificity as bonding to increase length of activity (haif cife) and specificity as bonding to increase length of activity and the activity of activity (haif cife) and specificity as bonding to increase length of activity (haif cife) and specificity as bonding to increase in the body.

CC AABS0829 to AAS9241 represent peptides which can be used in the creases are considered in the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            modulator, a central nervous system modulator or a pancreatic function conditator. This ligand could have specific applications as a prophylactic or therapeutic agent for dementia, depression, hyperkinetic syndrome, disturbance of consciousness, anxiety syndrome, schizophrenia, trauma, growth hormone secretory disease, hyper- and polyphagia, hyperprolactinaemia, disbetes, cancer, pancreatitis, renal disease, hyper-prolactinaemia, disbetes, cancer, pancreatitis, renal disease, hyperprolactinaemia, neurosis, asthma, rheumatoid arthritis, spinal injury, translent brain ischemenia, epilepsy, amylotrophic lateral scicrosis, acute myocardiai infarction, infertillty, spinocerebeliar degeneration, bone fracture, trauma, atopic dermatitis, osteoporosis and/or oligogalactia. Assays can also be developed to screen compounds which are capable of altering the binding activity of the ligand affecting activation of the G protein-coupled receptor protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

The present sequence describes a method of controlling the secretion of conticotrophin releasing hormone (CRH), involving the use of a G protein receptor ilgand. This can be used to control the secretion of CRH and is useful as an analgesic or for treating, preventing or ameliorating diseases associated with CRH secretion such as hyperaldosteronism, hypercortisolsemia, secondary or chronic hypoadrenocorticism, Addison's disease (including boredom, nausea, plgmentation, hypogonadism, hair loss, and hypotension), adrenal gland hypofunction and obesity. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes a novel oxytocin secretion-regulating agent which contains a ligand peptide or its sait for the 6 protein-coupled receptor protein. It is useful in the form of drugs for ameliorating, preventing and treating diseases relating to oxytocin secretion e.g. weak pains and atonic bleeding, before and after expulsion of placenta, uterine recovery failure, caesarean section, stoppage of artificial fertilization or galactostesis and is also applicable in veterinary medicine for promoting milk production in cow, goat and pig. This sequence represents a human peptide which acts as an oxytocin secretion

CC ligand polypeptide corresponding to amino acid residues 34 to 55 of the CS sequence represented in ANW31390 and is used in an assay to monitor CC ligand binding to the G protein-coupled receptor protein. Pharmaceutical CC compositions containing this ligand may be used as a pituitary function CC modulator. This ligand could have specific applications as a CC prophylactic or therapeutic agent for dementia, depression, hyperkinetic CC syndrome, disturbance of consciousness, anxiety syndrome, schizophrenia, CC trauma, growth hormone secretory disease, hyper-and polyphagia, CC hyperlipidaemia, hypercholesterolaemia, hypercidaemia, phyperchaetinaemia, diabetes, cancer, pancreatitis, renai disease, hyperprolactinaemia, diabetes, cancer, pancreatitis, renai disease, cc Turner's syndrome, neurosia, asthma, rheumatoid arthritis, spinal injury, transient brain ischaemia, epilepsy, amylotrophic lateral scierosis, cc bone fracture, trauma, atopic dermatitis, osteoporosis and/or collopolatetia. Assays can also be developed to screen compounds which are CC capable of altering the binding activity of the itenna affection.

                                                                                                This invention describes a novel oxytocin secretion-regulating agent which contains a ligand peptide or its salt for the G protein-coupled receptor protein. It is useful in the form of drugs for ameilorating, preventing and treating diseases relating to oxytocin secretion e.g. weak palms and atonic bleeding, before and after expulsion of placenta, uterine recovery fallure, caesarean section, stoppage of artificial fertilization or galactostasis and is also applicable in veterinary medicine for promoting milk production in cow, goat and pig. This sequence represents a human peptide which acts as an oxytocin secretion

This can be used to control the secretion of CRH and is useful as an analycsic or for treating, preventing or ameliorating diseases associated with CRH secretion such as hyperaldosteronism, hypercortisolaemia, secondary or chronic hypoadrenocorticism, Addison's disease (including boredom, nausea, pigmentation, hypogonadism, hair loss, and hypotension), adrenal gland hypofunction and obesity, The present sequence is a peptide used in the exemplification of the

                                                                                                                     Ş
                                                                                                                                                                                                                                             This sequence represents a peptide fragment from a novel human type colligand polypeptide corresponding to amino acid residues 23 to 53 of the consequence represented in AAW31390 and is used in an assay to monitor cligand binding to the G protein-coupled receptor protein. Pharmaceutical compositions containing this ligand may be used as a pituitary function modulator. This sigand could have specific applications as a prophylactic or therapeutic agent for dementia, depression, hyperkinetic syndrome, schizophrenia, compositions of consciousness, anxiety syndrome, schizophrenia, compositions, growth hormone secretory disease, hyper- and polyphagia, hyperfipidaemia, hypercholesterolaemia, hyperglyceridaemia, hyperfipidaemia, diabetes, cancer, pancreatitis, renal disease, hyperprolactinaemia, diabetes, cancer, pancreatitis, renal disease, hyperprolactinaemia, epilepsy, anylotrophic lateral sclerosis, caute myocardial infarction, infertility, spinocerebeliar degeneration, counter myocardial infarction, infertility, spinocerebeliar degeneration, counter fracture, trauma, atopic dermatitis, osteoporosis and/or collogogalactia. Assays can also be developed to screen compounds which are capable of altering the binding activity of the ligand affecting cativation of the G protein-coupled receptor protein.
                                                                                                                                                        Query Match
